

At a Glance

CALM is a comprehensive log management solution that allows organisations to log all their IT infrastructure events to one platform and overlay threat intelligence and advanced security analytics to the events collected. CALM provides the required reporting and features for all major compliance schemes, while providing a lower TCO for Security Incident and Event Management. The combination of versatile cost efficient logging and analytics, ultimately makes it possible to detect breaches and malicious behaviours without the requirement for dedicated staff to monitor and manage logs and log correlation rules.

Log all your data

The commercial model of CALM allows for unlimited logging. This provides customers with a cost efficient approach to the collection of all logs within their organisation. Being able to collect user activity logs is imperative to detecting security breaches, as most breaches today happen at the end-point. Most SIEM platforms, while capable of logging data, are simply cost prohibitive as they are charged by data volume.

CALM has logging agents and syslog parsers which work with all major operating systems and hardware vendors.

Use your data

Servers, computers, network devices and all other IT infrastructure by default generate lots of logs. CALM provides you with a single pane of glass overview of all IT infrastructure events. This enables customers to monitor and alert for particular events such as failed account logins, changes to administrative accounts or critical security events which could otherwise be missed. CALM overlays security intelligence across logs collected and alerts customers to threats within their infrastructure.

Key Features

- **Cloud Hosted or On-premise delivery**
CALM will run in Cybanetix private cloud, on CALM appliances or on customer specified hardware. This enables customers to procure and deploy the solution to fit their infrastructure strategy.
- **Scales horizontally**
The database and the software architecture of CALM ensures that it scales horizontally, which enables customers to start with a small deployment, but then linearly scale their logging platform through the addition of hardware resources.
- **Ease of use**
CALM has been designed with simplicity in mind. Ease of use encourages more use of the technology, which ultimately leads to improved security. Ease of use is key in small IT teams that do not have dedicated security staff to work on their SIEM on a daily basis.
- **Log from anywhere**
CALM supports logging from all major hardware vendors and cloud providers which in combination with the commercial model, allows customers to log from everywhere and ultimately improve their security.
- **Correlate events with known threats**
With advanced threat Intelligence overlay, events are enriched with live threat data allowing real-time threat detection and alerting.
- **Tracks and Trends your user behaviour**
With an advance analytics overlay from Exabeam, user behaviours are tracked against their normal behaviours and flagged if they are acting maliciously.
