

## About us

Cybanetix is a next-gen Cyber Security provider working to combat today's constantly evolving cyber security and threat landscape.

We aim to be trusted advisors to our customers and build lasting partnership through providing expert advice, a 360 degree security technology portfolio and a comprehensive service offering.

Customers security requirements differ significantly depending on industry, size and geography. We work in collaboration with our customers to design security solutions which will support their working practices and improve their security posture.

### A Security Technology Eco System

At Cybanetix we have chosen to work with a select number of technology partners which cover all aspects of cyber security. This eco-system of technologies is designed to make each technology strengthen the other through natural integrations, ultimately making our solutions more secure.

## Expertise and Service

Cybanetix has extensive experience working with customers to plan, assist and manage large scale migrations from their legacy security implementations, to new solutions and technologies. In addition to the implementation and migration of security technologies, Cybanetix has a comprehensive service and consultancy offering; providing customers with expert advisory, outsource and managed services for cyber security and compliance.

## Solutions

Cyber Security technology spans every aspect of any organisations IT infrastructure as well as any externally available information; which inevitably means that most organisations deploy and manage in excess of 7 different inter-linked security technologies.

The complexity of the market inevitably makes it hard to understand the risks to your business and which technologies are appropriate to mitigate any risks that are identified. As an organisation, it is therefore increasingly hard to keep up with the latest technologies and determine which strategy is the right one.

Cybanetix has leading Security Architects and Technology experts continuously assessing emerging technologies as well as the development of existing ones. This means we are very well placed to give you advice on how to address your security requirements.
